The Breadth of the Candidate Set

Friday, November 18, 2016
2:40 PM
Location: HUM 2 - Room 259

Abstract:
How broad is the candidate set that the phonological grammar optimizes over? Does the grammar consider multiple pronunciations of the words in the utterance (There are two wug[s] vs. There are two wug[z]), variant constructions with small semantic differences (There are two wugs vs. Two wugs are there), or options with much bigger semantic differences (There are two wugs vs. I can see a couple of little birds)?

This talk aims to contribute to this debate with data expanded from a 2015 written corpus study of French coordinated structures of the form de X et/ou (de) Y 'of X and/or (of) Y', such as de tomates et (de) carottes 'of tomatoes and (of) carrots'.
